Bamboo Plugin for leading Web App Scanner

Web App Scanner

Plugin makes REST API calls to the platform to perform web app scan

Bamboo

Plug-In

Customer

Customer is a leading SaaS based Application security solution provider

Requirement

Client requested for the development of certified Bamboo plugin that would perform application vulnerability scans into existing continuous integration pipeline.

Technology Solution

- Sacumen developed the certified Bamboo plugin
- The plugin was written in Java language using the Bamboo Plugin framework
- After Bamboo pipeline builds the web App, the plugin launches a scan on the selected web application with the configured options. Plugin makes the REST API call to the platform to perform the scan
- User has ability to define the failure criteria. Failure criteria is built based on severity of vulnerabilities, QID values etc. If the failure conditions are met then the Plugin will fail the build
- After scan is performed, customers will be able to see results in Bamboo
- Bamboo plugin can be installed directly from the Manage Add-Ons screen in Bamboo
- Support for Bamboo v8.7.0 to v8.8.0
