

Data protection platform integration with a leading Incident Response platform

Incident Response Platform

Workflow Initiator

Function 1

Function 2

Function makes the REST API calls to the Data protection platform and the underlying Incident Response platform to independent various use cases

Data Protection Platform

Customer

Customer is a leading Data Protection solution provider.

They have security software platform to let organizations track, visualize, analyze and protect their structured and unstructured data

Customer requested for the integration of their product with a leading Incident Response platform

Requirement

Technology Solution

- Sacumen developed the Python based Functions for the Use cases shared by client. Also the resolving methods (eg: get User id by providing Username) will be developed as required. Functions simplify development of integrations by wrapping each activity into an individual workflow component
- Each customer can create its own custom playbook using these functions as part of workflow
- Use cases involved information retrieval, triggering action on client's platform based on certain rules/alerts, update/close tickets based on certain conditions/attributes
