

Qualys integration with Threat Intelligence Platform

Connector uses the Qualys V2 Scan APIs to first list the Vulnerability scans in User's account and then fetch the completed scan results in JSON format

Threat Management Console

Connector

Connector app parses JSON reports data and writes to SysLog format

Agent will read this SysLog feed data, process and feed into platform for display

Customer

Customer is a leading Threat Intelligence solution provider.

They provide a platform for companies to aggregate and act upon Threat Intelligence.

Customer requested for the integration of their product with the Qualys Vulnerability Scan reports

Requirement

Technology Solution

- Connector uses the Qualys V2 Scan API to fetch the vulnerability scans list and then completed scan reports in JSON format
- The Connector receives the events data and parses response data and writes in the Syslog format
