

# Salesforce integration with Threat Intelligence Platform

## Customer

Customer is a leading Threat Intelligence solution provider.

They provide a platform for companies to aggregate and act upon Threat Intelligence.

Customer requested for the integration of their product with the Salesforce audit trail events

## Requirement

## Technology Solution

- Sacumen developed the Connector app that uses the SOQL(Salesforce Object Query Language) over REST API call to fetch the Audit trail data from SF system
- Connectors will then parse events data applying string manipulation for “details” field and write it into the LEEF format
- API Test Methods and Selenium automation scripts were written for events generation
