

## Travis CI Plugin for leading SAST

SAST PLATFORM

Plugin makes REST API calls to the platform to perform repo scan

Customer is a leading CASB solution provider

## Customer

Client demanded development of a Travis CI plugin that would perform static scanning into the existing build processes

## Requirement

## Technology Solution

- Sacumen developed the yml build script for Travis CI which will be added to .travis.yml file
- User has ability to define the Failure Criteria, Scan API details as Environment Variables in Travis CI
- The script bundles the code as a .zip file and makes the REST API call to the platform to perform the scan.
- Failure criteria is built based on severity of vulnerabilities, QID values etc. If the failure conditions are met then the script will fail the build
- After scan is performed, customers will be able to see results in the build log
